

Abstract

A device for holding an odor-producing repellent. The device comprises two oppositely disposed compartments for holding the repellent and a pair of substantially parallel strips connecting the pods together. Each pod includes a cap for enclosing each pod and a plurality of slots on both the pods and the caps for allowing the odor-repellent to be released into the immediate atmosphere. The device is flexible and can be secured to a treebranch by twisting one pod and placing it between and through the connecting strips. Once through, the pod is secured in place and cannot return through the strips, thereby securing the device to a treebranch.
